Multi-channel, Multi-Radio, Directional Antenna

CS/E

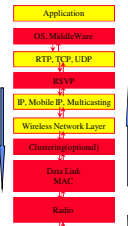

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

Two Issues for Collaborative Computing

CS/E

- ◆ Network Layer Collaborative:
 - Ad hoc~ Infrastructure-less ~ support "anytime, anywhere"
 - To support communications between ad hoc nodes
 - ◆ To guide the packets effectively to satisfy different requirements
 - ◆ To adjust to dynamical topology change (due to Mobility)
- ◆ Application Collaborative:
 - Video Conferencing, News Broadcasting
 - Group of users to share the same information
 - Mobility Support

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

Trend Evolution

CS/E

- IP success
 - The involvement and level of responsibility of end users have dramatically increased
 - The freedom has fueled creativity
- Infrastructure-less, self-organized networks
 - The network runs solely by operation of end users
 - Progress of electronic integration and wireless communication
 - Complement these infrastructures in cases where cost, constraints, or environment require self-organized solutions
 - Will be interconnected with the Internet and cellular networks

Mesh Network Scenario

CS/E

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Why not existing routing protocol

CS/E

- Existing routing protocol search for shortest path not guarantee any QoS.

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Bandwidth influence ~ hidden route problem

CS/E

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Traffic aggregation of existing flow

CS/E

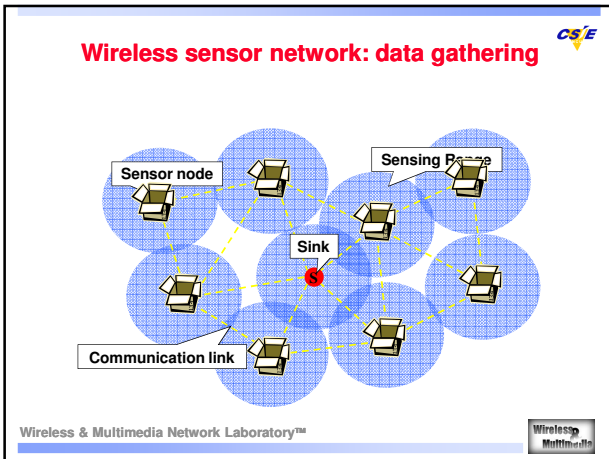

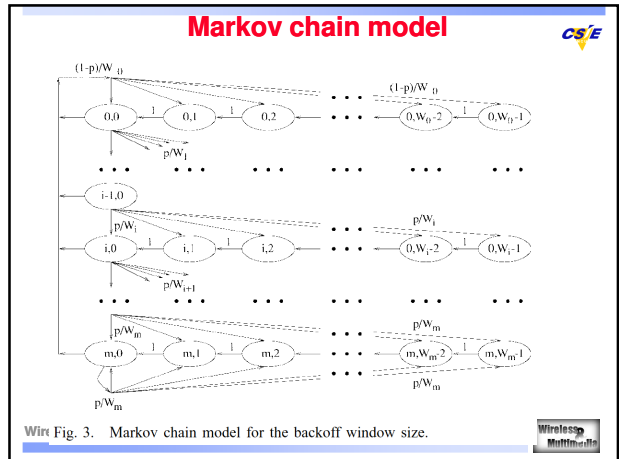

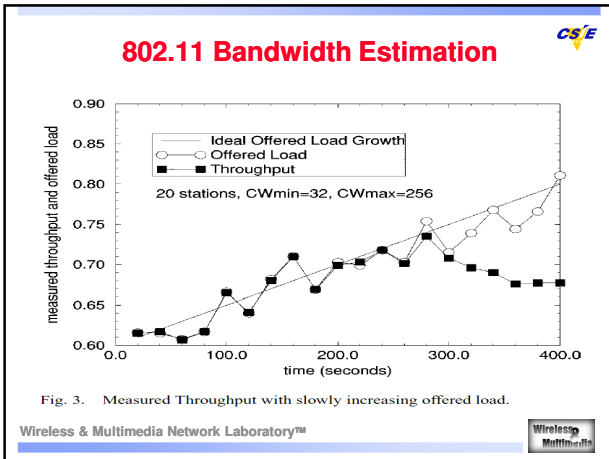

B_{self}: Tx or Rx by I.
B_{neighborhood}: traffic between I's neighbors.
B_{boundary}: connection cross I's access range.

$$B_{\text{available}}(I) = B - \sum_{J \in N(I)} B_{\text{self}}(J).$$

Wireless & Multimedia Network Laboratory™

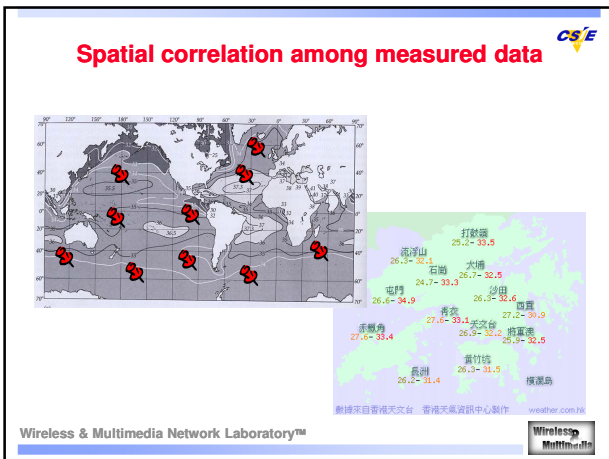

Wireless
Multimedia

Energy constraint of sensor network

- ◆ Battery-equipped, limited energy
- ◆ Remote environment, re-charge is hard

Wireless & Multimedia Network Laboratory™

Correlated data encoding for energy efficiency

- ◆ Exploit spatial correlation to encode measured data to reduce amount of information.
- ◆ Explicit communication approach proposed by Razvan Cristescu et al. IEEE/ACM Trans. On Networking 2006.

Wireless & Multimedia Network Laboratory™

Explicit communication approach

Wireless & Multimedia Network Laboratory™

Explicit communication approach

- $H(X_i)$ is entropy of random variable X_i , and represents the amount of information.

Transmission Rate : $R_1 = H(X_1)$ $R_2 = H(X_2)$ $R_3 = H(X_3)$

(a) Transmission cost when data are independent.

Transmission Rate : $R_1 = H(X_1)$ $r_2 = H(X_2|X_1)$ $r_3 = H(X_3|X_1)$

(b) Transmission cost when data are dependent.

Wireless & Multimedia Network Laboratory™

Joint optimization of rate allocation and routing path

Correlation Coefficient = $1 - r_i/R_i$

Correlation Coefficient (A,B)=0.7 (A,C)=0.5 (B,C)=0.9

Total cost = $20 \cdot 2 + 22 \cdot 2 + 2 = 86$

Total cost = $22 \cdot 3 + 6 \cdot 2 + 2 = 80$

Wireless & Multimedia Network Laboratory™

Video Transmission in VANET

GPS gets instant video streams from the surveillance cameras at an intersection.

The driver can get a better view of the traffic.

Wireless & Multimedia Network Laboratory™

What is a VANET (Vehicular Ad hoc Network) ?

IEEE 802.11p WAVE (Wireless Access in Vehicular Environment) communication std., also known as DSRC (Dedicated Short Range Communication) protocols

Wireless & Multimedia Network Laboratory™

VANET vs. MANET

- VANET can be considered as one of concrete applications of MANETs in the future
- The difference between VANET and MANET
 - (i) VANET have vehicles as network nodes and their main characteristics are highly mobility and speed
 - (ii) VANET nodes move non-randomly along specific paths (roads)
 - (iii) VANET nodes are vehicles, so there are less power and storage constraints
- Due to the characteristic of (i) (ii), VANET will suffer *rapid changes in network topology*, and will be subject to *frequent fragmentation*

Wireless & Multimedia Network Laboratory™

Vehicular communications: why?

- Traffic jams generate a tremendous waste of time
- Try to improve driving safety and traffic management while providing drivers and passengers with Internet access

Wireless & Multimedia Network Laboratory™

Applications of vehicular communications

- There are many applications envisioned for VANETs, we can divide the applications into two major categories:
 - **Safety-related applications**
 - Collision avoidance
 - Cooperative driving
 - **Non-safety (private) applications**
 - Traffic optimization
 - Payment services (toll collections)
 - Location-based services (find the closest fuel station)
 - Infotainment (Internet access)

Wireless & Multimedia Network Laboratory™

Scenario of VANET safety applications

Multicasting warning messages

Wireless & Multimedia Network Laboratory™

Scenario of VANET private applications

Multicasting infotainment messages

Wireless & Multimedia Network Laboratory™

Vehicular Ad Hoc Network Scenario

Wireless & Multimedia Network Laboratory™

Vehicular Ad Hoc Network Scenario

• more fun,

• ... and easier maintenance

Wireless & Multimedia Network Laboratory™

Observations

Personal Communications have been the dominant paradigm so far, but **mobile ad hoc networks** open new possibilities, such as the communication between objects

Reading

- ♦ [Jean2001] Jean-Pieere Hubaux, Thumas Gross, Jean-Yues Le Boudec, and Martin Vetterli, "Toward Self-Organized Mobile Ad Hoc Networks: The Terminodes Project"
- ♦ [Ian 2005] Ian F. Akyildiz, A Survey on Wireless Mesh Networks, IEEE Radio Communications September 2005

Agenda

- ♦ Overview of Mobile Ad Hoc Networks
- ♦ Major Technical challenges:
 - Networking
 - Real time services
 - Software
- ♦ Long-term Research Project:
 - Terminodes Projects

Cellular based

GSM Network Infrastructure

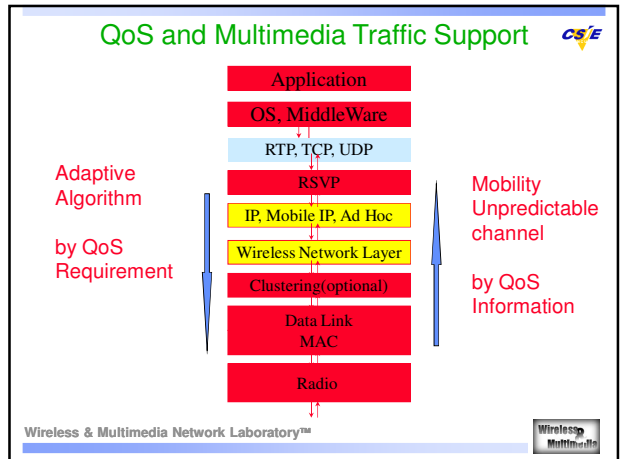

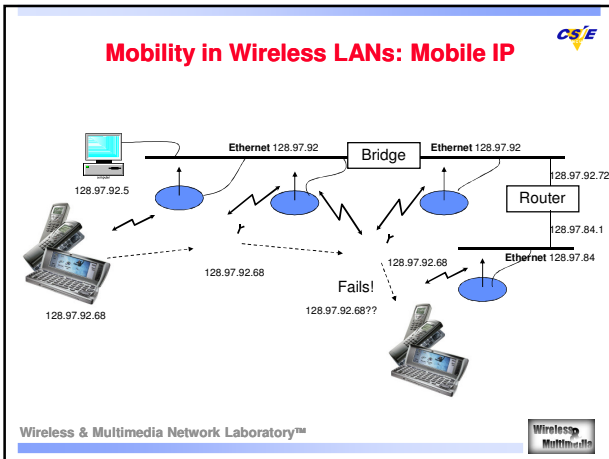

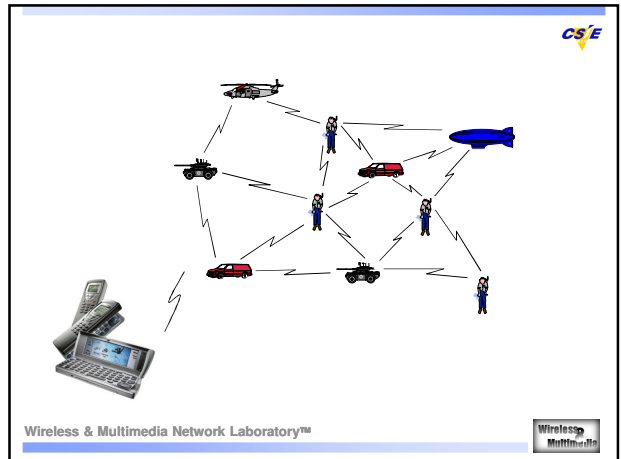

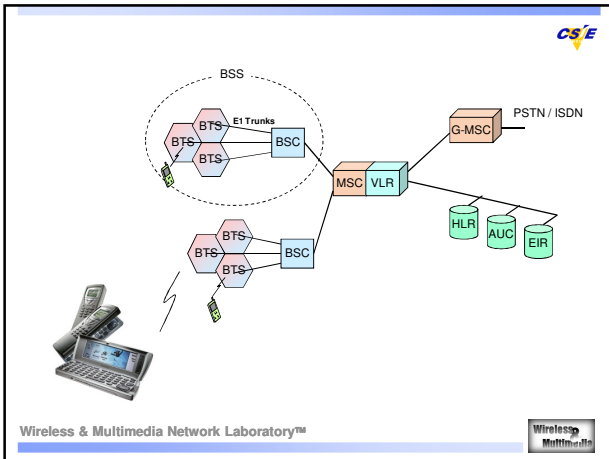

Ad-hoc network

- ♦ No centralized controller (base stations)
- ♦ No wired inter-connection backbone
- ♦ Forwarding function should be provided by mobile nodes

Introduction

Self-Organized Mobile Ad Hoc Networks

- ## Overview (MANET)
- ♦ Packet Radio Networks ('70)
 - Research Results
 - ♦ Radio Resource Allocation
 - ♦ Network Organization
 - An Individual, handheld device
 - Military application (provide person-to-person communications on the battlefield)
-

MANET

- ◆ Potential Applications:
 - Manmade disasters
 - Relief operation
 - Military applications
 - Car-based networks
 - Sensor networks
 - The Provision of wireless connectivity in remote areas
 - Collaborative Computing, Video Conferences

Wireless & Multimedia Network Laboratory™

MANET, Peculiarities

- ◆ They can act independent of any provider
- ◆ They have to be highly cooperative: The tasks are distributed over the nodes
- ◆ Any operation is the result of the collaboration of a group of them
- ◆ The nodes rely on batteries for their energy, energy saving
- ◆ Power aware: the set of functions offered by a node depends on its available power
- ◆ Highly dynamic topology
- ◆ Security is difficult to implement

Wireless & Multimedia Network Laboratory™

Technical Issues

- ◆ Routing
- ◆ Mobility Management
- ◆ IP Address
- ◆ Transport Layer
- ◆ Air Interface
- ◆ Security
- ◆ Power Management
- ◆ Standards and Products

Wireless & Multimedia Network Laboratory™

Routing

- ◆ Ad hoc routing
 - Different from traditional solutions in the Internet or cellular phone networks (relative stable, distributed routing databases)
 - IETF (The Internet Engineering Task Force) MANET address the challenge
 - Distant vector, links state, source routing (table driven, on-demand)
 - Geographic methods: nodes are informed of their own geographic position

Wireless & Multimedia Network Laboratory™

Routing Protocol

- ◆ Traditional Routing
 - Distance Vector (Bellman Ford)
 - Link State
- ◆ Ad Hoc Routing Protocols
 - DSDV
 - DSR
 - AODV
 - TORA

Wireless & Multimedia Network Laboratory™

Traditional Routing

- ◆ Distance Vector (Table Driven)
 - Each node maintains its own routing table
 - Routing table contains
 - ◆ destination node index
 - ◆ next hop
 - ◆ metric
 - Periodic routing table exchange
- ◆ Disadvantage
 - Count-Infinity Problem
 - Convergence Problem

	A	B	C
B-A-1		A-B-1	B-C-1
		C-B-1	
B-B-1		A-B-1	B-B-1
C-B-2		C-B-1	A-B-2
0	1	2	
x	1	2	
x	3	2	
x	3	4	
x	5	4	
	↓		
x	∞	∞	

Wireless & Multimedia Network Laboratory™

Traditional Routing (Cont.)

CS/E

- ◆ Link State Routing
- ◆ Procedures
 - Neighbor Discovery
 - Routing Information Broadcast
 - Shortest Path Finding (e.g. Dijkstra's algorithm)

- ◆ Disadvantage
 - short-live looping problem

	0	1	2	3	4	5	6	7	8	9	10	11	12
0		X											
1		X											
2	X	X	X										
3			X	X	X								
4			X	X	X	X							
5				X									
6				X									
7			X			X	X						
8					X								
9					X								
10			X					X	X				
11								X					
12								X					

adjacency matrix

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Ad Hoc Routing - DSDV

CS/E

- ◆ DSDV
 - Destination Sequence Distance Vector Routing
 - Each route information is labeled with a increasing sequence number
 - Route info. with greatest number will be update
 - Route info. of broken link is broadcast with odd sequence one greater than the original sequence number
- ◆ Contribution
 - Main contribution of DSDV is freedom-loop guarantee
- ◆ Disadvantage
 - The periodic broadcast adds the overhead into the network

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Ad Hoc Routing - DSR

CS/E

- ◆ DSR
 - Dynamic Source Routing
 - Route Discovery
 - Source node flooding routing request (RREQ) packet
 - Destination (inter-node) node reply RREP packet that piggybacks the route info.
 - Source node caches the route info
 - Route Maintenance
 - The route info. will be remove after receiving RERR packet
- ◆ Advantage
 - Requires no periodical routing exchange
- ◆ Disadvantage
 - packet is larger because of carrying route info.

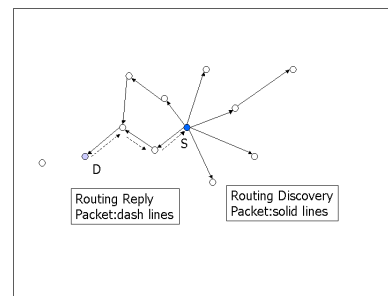

Wireless & Multimedia Network Laboratory™

Wireless & Multimedia Network Laboratory™

Wireless
Multimedia

Internet Interconnection and Mobile IP CS/E

- DSR support the seamless interoperation between an ad hoc network and the Internet

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

On Demand Support Multicast & QoS CS/E

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

Ad Hoc Routing - AODV CS/E

- AODV
 - Ad-hoc On-demand Distance Vector
 - Shares the advantages of DSR and distance vector
 - Route Discovery
 - Similar to DSR
 - Route Maintenance - Table Entry
 - Destination IP, Destination Sequence, Hop Count, Next Hop, Life Time
 - The route info. Is invalid if
 - Life Time is expired
 - Receive RERR packet

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

Ad Hoc Routing - TORA CS/E

- TORA
 - Temporally-Ordered Routing Algorithm
 - Routing procedures
 - Flood QUERY packet
 - UPDATE packet will be broadcast from destination or inter-node
 - HEIGHT info. is appended to UPDATE packet
 - the node receives UPDATE packet set its height and the forwarding UPDATE packet's height to a value one greater than original one
 - Source node send data to the destination via neighbor that have lower height with respect to the destination
- Advantage
 - Minimizes the reaction due to changes of network topology
- Disadvantage
 - Depend on Internet MANET encapsulation Protocol, the overhead is large

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

Ad Hoc Routing - TORA (Cont.) CS/E

Directed acyclic graph rooted at destination

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

ABR (Associativity-Based Routing) CS/E

- ABR considers the stability of a link.
 - The metric is called **degree of association stability**.
- Basic Idea:
 - Each node periodically generates a beacon to signify its existence.
 - On receipt of the beacon, a neighboring node will increase the "tick" of the sender by 1.
 - A higher degree of association stability (i.e., ticks) may indicate a low mobility of that node.
 - A low degree of association stability may indicate a high mobility of that node.
 - When a link becomes broken, the node will set the tick of the other node to 0.

Wireless & Multimedia Network Laboratory™ Wireless Multimedia

ABR Outline

- ◆ Route Discovery:
 - (similar to DSR)
 - ◆ On needing a route, a host will broadcast a ROUTE_REQUEST packet.
 - ◆ Each receiving host will append its address to the packet.
 - The **association stability** (represented by "ticks") is also appended in the ROUTE_REQUEST packet.
 - The destination node will select the **best route** (in terms of association stability), and then respond a packet to the source.

Wireless & Multimedia Network Laboratory™

- ◆ Route Reconstruction:
 - On route error, a node will perform a local search in hope of rebuild the path.
 - If the local search fails, a ROUTE_ERROR will be reported to the source.

Wireless & Multimedia Network Laboratory™

Mobility Management

- ◆ Broadcasting a paging message the whole network: won't scale well
- ◆ Different from centralized servers (either HLR in GSM), location must be distributed among the nodes
- ◆ Prediction of the future locations

Wireless & Multimedia Network Laboratory™

Radio Interface

- ◆ CSMA/CA: hidden terminal

- ◆ Defining master and slaves roles: Bluetooth

Wireless & Multimedia Network Laboratory™

MACA/PR

- ◆ The key component
 - the MAC protocol for data transmission
 - Reservation scheme for real-time connection setup
 - QoS Routing algorithm

Wireless & Multimedia Network Laboratory™

MACA/PR - MAC

- ◆ Data-gram Traffic
 - RTS - CTS - PKT - ACK
 - <RTS,CTS> for hidden terminal avoidance, ACK for retransmission
- ◆ Real-Time Traffic
 - < RTS - CTS > - PKT - ACK
 - <RTS,CTS> used for first time transmission to set up the reservation
 - ACK for renewing the reservation, not recovery

Wireless & Multimedia Network Laboratory™

MACA/PR - Reservation/QoS Routing

- ◆ CYCLE is the max. interval allowed between two real-time packets
- ◆ Each node maintains its own reservation table
- ◆ DSDV routing is employed
- ◆ Bandwidth info. can be easily obtained via reservation table

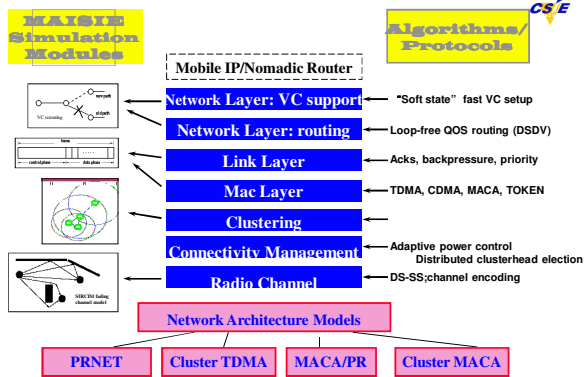

Reservation Schedules - Slotted Case

Wireless & Multimedia Network Laboratory™

MACA/PR - Properties

- ◆ Asynchronous approach
- ◆ Low latency, low packet loss rate
 - Hidden Terminal Problem is solve automatically
- ◆ Fair bandwidth sharing
- ◆ Good mobility handling
 - Maintain secondary routing path
- ◆ Low implementation costs

 (2) face-changes

Walking sequence:
 $F_1 \rightarrow F_2 \rightarrow F_3 \rightarrow F_4$

Scenarios Where GPCR does not work Well

For Destination D2, the source A has to send to C even if it can send directly to more closer node B.

For Destination D1
The source A has to send to C (Junction node) then to B (because it is closer to D1 than F), then G. Then it goes for recovery mode because G is the local maxima and return back to C. C sends to F and finally Data is sent to D1.

Wireless & Multimedia Network Laboratory™

Routing for Terminode

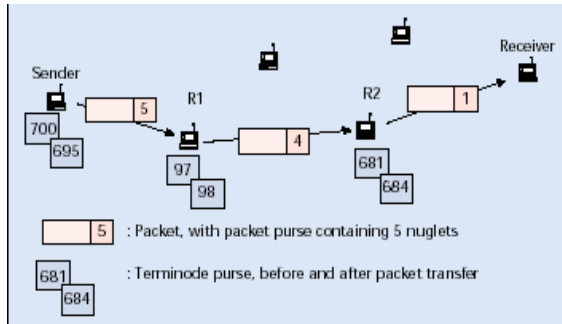

- ◆ Each Terminode has
 - A permanent unique node identifier, EUI (End System Unique Identifier)
 - Location-Dependent Address (LDA)
- ◆ Geodesic Packet Forwarding:
 - The packet is forwarded to the neighbor closest to the direction in which the destination is located
- ◆ Terminode local routing
 - MANET routing (link State, Distance Vector, Source Routing)

Wireless & Multimedia Network Laboratory™

Networking Issues

Wireless & Multimedia Network Laboratory™

Virtual Currency (Nuglet)

- ◆ Service Availability is a major requirement for self-organization
- ◆ The End users must be given incentive to cooperate
- ◆ They must be encouraged to not overload the network

Wireless & Multimedia Network Laboratory™

Multiple description coding

Wireless & Multimedia Network Laboratory™

Real-Time Services over Ad hoc Networks

- ◆ Real-Time Services
 - Voice or video over ad hoc networks
 - Unreliable <-> stringent delay
 - Large error , node failure
- ◆ Redundancy, error correction codes over parallel connections

Wireless & Multimedia Network Laboratory™

Software Aspects

- ◆ Software implementations:
 - Base software: Routing algorithms, accounting system and security system
 - Application software: Software that makes a collection of terminodes useful for a client
 - Flexible software architectures
- ◆ Resource Allocations
 - Contract
 - Loader
 - Dynamic checks

Discussions

- ◆ Three Networks:
 - Telecom networks
 - The Internet
 - Self-Organized Mobile Ad Hoc Networks

Network	Infrastructure	Security	Applications
Telecom networks	Telcos	Telcos	Telcos (IN)
Internet	ISPs + telcos	ISPs + users (PGP)	Users
Self-org. ad hoc NW	Users + vendors	Users + vendors	Users
